

## PROCESS STANDARD DIGITAL – PRINTING THE EXPECTED

establishing and implementing  
typical guidelines

Highlights

For later reading

### PRINTING THE EXPECTED

- ⇒ **Not just THE EXPECTED, but across**
  - ⇒ Different printing technologies
  - ⇒ Different substrates
  - ⇒ Production batches
- ⇒ **Example in LFP**
  - ⇒ WALL -> Free-PVC Wallpaper
  - ⇒ CAR DOOR
    - ⇒ BODY ->Self-adhesive Vinyl (SAV)
    - ⇒ WINDOW ->Oneway View SAV
  - ⇒ FLOOR -> Floor graphics SAV
  - ⇒ GLASS -> Wasn't suppose to be in the picture

## PSD – CODE OF PRACTICE

- ⇒ **PSD guidelines have been published by Fogra in 2012**
  - ⇒ Online version is free of charge (<http://www.fogra.org/en/fogra-fogracert-en/print/processstandard-digital/psd-downloads-e/psd-downloads-en.html>)
- ⇒ **Digital Printing Working Group (Committee)**
  - ⇒ Creating, promoting and encouraging the standardization and evolution of vendor neutral digital printing
  - ⇒ Discussion and further development
- ⇒ **PSD & ISO/TS 15311 – interplay and use case dependent facilitation of the standards**
  - ⇒ ISO 15311-1 is at CD stage, -2 / -3 (ISO/TS track)
  - ⇒ PSD will reflect the ongoing developments ("Living document")

3

## HOW PSD IS ADDRESSING DIGITAL PRINTING NEEDS

**1. Output Process Control**

✓

Large Format

Small Format

✓

**2. Colour Fidelity**

Proof to Print Match

✓

⇒ Stability

⇒ Printing the Expected

**3. Workflow**

- ✓ Data Preflight
- ✓ PDF/X Creation

- ✓ PDF/X Output
- ✓ Altona Test Suite V2

- ✓ Colour Management
- ✓ Viewing Conditions

4

## DATA EXCHANGE WITH PDF/X - PREPARING THE EXPECTED

- ⇒ **PDF/X is the ideal data exchange format for the printing industry**
- ⇒ **The purpose of PDF/X is to facilitate graphic content exchange**
  - ⇒ Specific requirements linked to production workflow needs
  - ⇒ PDF/X-4 it is a desirable choice due to its features
- ⇒ **Goal: AUTOMATIZATION**
- ⇒ **PDF/X Profiles**
  - ⇒ Creation
  - ⇒ Preflight
  - ⇒ Correction (Fixing)
- ⇒ **PDF/X Output**
  - ⇒ Proper RIP – workflow settings (ex. overprint options)
- ⇒ **Your digital file data will output as good as it was created and processed !!!**

5

## PDF/X “PLUS” PROFILES

- ⇒ **ISO 15930-X**
  - ⇒ PDF/X standards specifies minimum requirements
  - ⇒ Job and / or output specific needs are not covered by the standard scope
- ⇒ **Based on graphic industry's best practices in order to complement the standard and define the much needed parameters**
  - ⇒ Ghent Working Group – GWG, [www.gwg.org](http://www.gwg.org)

**BEST PRACTICES FOR PUBLISHING  
AND PACKAGING WORKFLOWS**

- ⇒ PDF/X-Ready, [www.pdfx-ready.ch](http://www.pdfx-ready.ch)

- ⇒ **Fogra web site**

- ⇒ <http://www.fogra.org/en/fogra-research/wc-digital-printing/digital-printing-current-projects/consolidating-standardization/research-topics/preflight-check/data-preflight.html>

6

## PDF/X “PLUS” TESTING

### ⇒ An aid to determine whether your workflows is behaving in conformance with the PDF/X standards

- ⇒ Ghent PDF Output Suite 4.0
- ⇒ PDFX-ready Output Test v3
- ⇒ Altona Test Test Suite 2 – Technical Page 2

### ⇒ External evaluation and certification of your PDF/X workflow

- ⇒ For data creators

- ⇒ For data processing

7

## PRINTING THE EXPECTED = MEASURE AS WE SEE

### ⇒ The printing condition

- ⇒ Digital press and its printing technology
- ⇒ Colorant
- ⇒ Substrate
- ⇒ Printing mode (LFP)

### ⇒ Tools

- ⇒ Measuring instruments
- ⇒ Measuring protocol
- ⇒ Charts and strips
- ⇒ Profiling application
- ⇒ Validation application

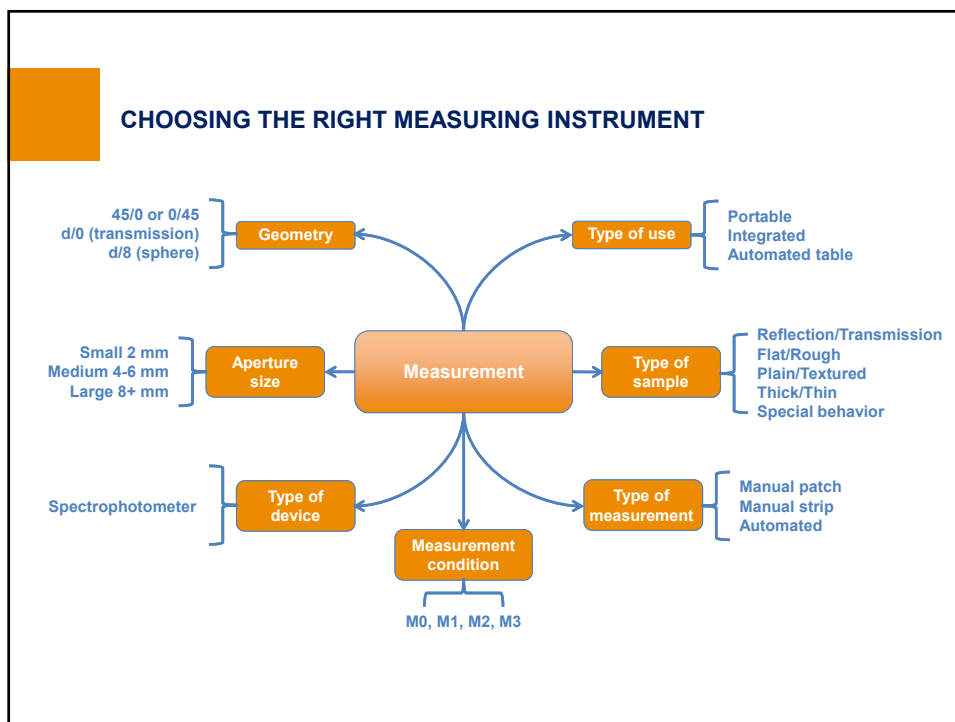

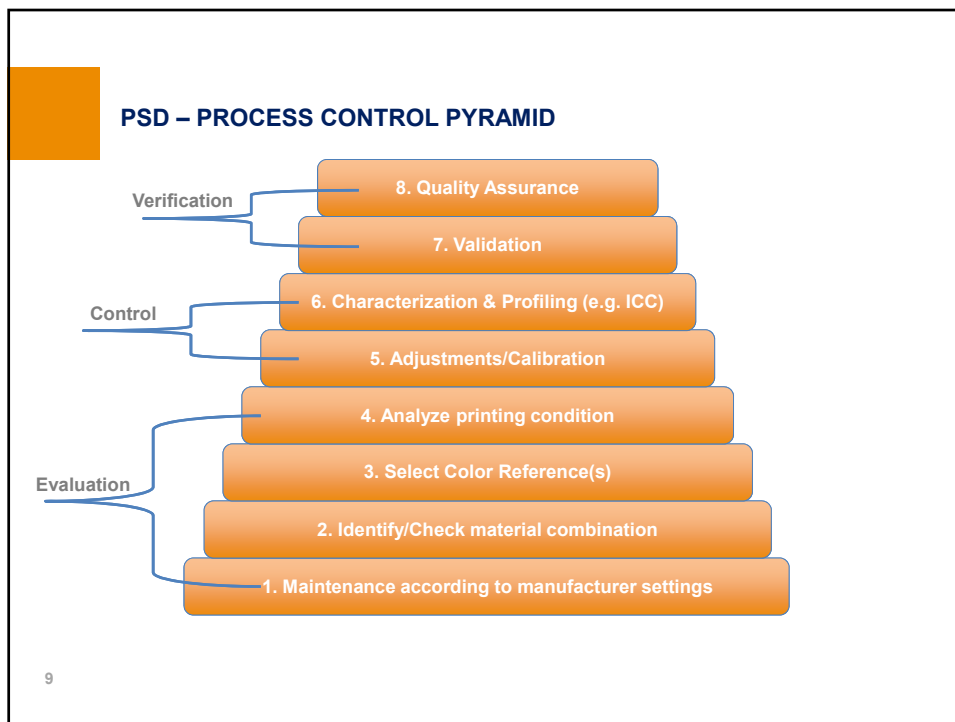

### ⇒ Visual judgment

- ⇒ Standard D50 viewing booth (P1/P2) or light box (T1) as described by ISO 3664:2009
- ⇒ Additional illuminants to evaluate colour metamerism/inconstancy

“Where you can measure, there is no need for dispute” – Prof. Dr. Joh. Albrecht, Fogra News Nr. 87, P. 2, 1976

8

## MEASURING PROTOCOL – BASED ON ISO 13655:2009

- ⇒ **Data**
  - ⇒ Spectral whenever possible
  - ⇒ No OBA's or media relative evaluation setup -> M0=M1=M2 by scope
  - ⇒ M1 whenever possible, but when using any M standard to exchange data, it is essential to agree on a particular M standard before measuring data
- ⇒ **Backing**
  - ⇒ Mostly measured on white backing
  - ⇒ All the printing condition (reference profiles) are generated based on measurements done on white backing
  - ⇒ Black backing is viable as an option for measuring special substrates (mesh, one-way view, textiles with lower opacity) due to better visual correlation
  - ⇒ Side-by-side comparison between thick and thin substrates
- ⇒ **Data quality and consistency**
  - ⇒ Averaging and smoothing

11

## INSTRUMENT PERFORMANCE AND STABILITY

- ⇒ **All measurement devices show random and systematic errors**
- ⇒ **Such errors can't be corrected by the user, but they can be detected**
  - ⇒ Check precision
    - ⇒ Short and long term repeatability
  - ⇒ Check accuracy
    - ⇒ How it agrees with other devices
- ⇒ **Periodical measurement of a stable material**
  - ⇒ Monitor and record the results
- ⇒ **A measuring device is only as good as its maintenance status**
  - ⇒ Preventive maintenance
  - ⇒ Recalibration and recertification in due time by manufacturer service

12

## BACKING COUNT TOWARD MEASURE AS WE SEE

⇒ One-way View SAV, Mesh substrates

13

## CHARTS DESIGN

⇒ From MediaWedge 3 LFP design experience:

- ⇒ All strip mode scanning devices are continuously illuminating the target and takes up to 200 measurements per second
- ⇒ Wider patches => Lots of measurements and averaging
- ⇒ Big enough  $\Delta E^*$  between adjacent patches eliminate the need for contrast bars
- ⇒ Same chart can be read by almost all measuring devices
- ⇒ Patch height should only count towards intended devices maximum aperture and to make chart less affected by miss positioning

14

## 1. MAINTENANCE AND BASIC SETUP

- ⇒ **A printing system is only as good as its maintenance status**
  - ⇒ Regular service maintenance
    - ⇒ Manufacturer periodically recommended operations
    - ⇒ Environment conditions of both printing system and substrates used
  - ⇒ User operations
    - ⇒ LFP
      - ⇒ Nozzle status check – certain close range viewing applications are sensitive to missing nozzles
      - ⇒ Print heads alignment (in-between and height)
    - ⇒ EP
      - ⇒ Density control and evenness
      - ⇒ Gamma (LUT) adjustments
      - ⇒ Color registration
- ⇒ **Good knowledge of the printer front panel and functions**
- ⇒ **If unsure, use default settings as starting point and tweak from there**

15

## 2. IDENTIFY AND CHECK MATERIAL COMBINATION

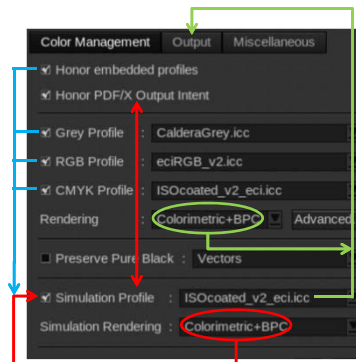

- ⇒ **Factor in both printability (testing & setup) and runnability (production)**
- ⇒ **Select the proper substrates recommended for the used printing technology**
  - ⇒ Not all substrates are suitable for all printing technologies
  - ⇒ Even if printability may be achieved, runnability may be an issue
- ⇒ **Choose the desired print mode(s), speed vs. quality (LFP)**
- ⇒ **Understand specific parameters for Printer (hardware) and Workflow (software)**
  - ⇒ Set a minimum printability level to qualify a substrate, then push the parameterization to find its limit
  - ⇒ Use printer vendor and substrate vendor knowledge base
  - ⇒ Simplify things – categorize substrates and their parameters
- ⇒ **For drying/curing printing systems, the temperatures applied during pre-printing, printing and post-printing stages are very important for both printability and runnability**

16

### 3. SELECT COLOUR REFERENCE(S)

- ⇒ **The achievable colour gamut results from the substrate and ink interaction and performance**
  - ⇒ The typical reference printing condition (exchange space) used - FOGRA39 (ISO\_coated\_v2.icc)
  - ⇒ While data may be supplied in different colour space, the focus should be on CMYK data
  - ⇒ Rel. Colorimetric +BPC rendering is most useful
- ⇒ **Modern workflows gives full control over RGB, CMYK, Gray, N-colour colour management settings for vector/bitmap**

Caldera colour Configuration  
 - Input to Simulation  
 - Simulation to Output

17

### 4. ANALYZE PRINTING COMBINATION

- ⇒ **Relevant considerations**
  - ⇒ Closest match of the color reference
  - ⇒ Stable gamut based on proper ink limits – no print defects to affect image quality
  - ⇒ Ink limits (per channel and total) affects the ink consumption – factor in the economical aspect of the printing
  - ⇒ Smooth gradations
  - ⇒ Print run stability
- ⇒ **Understand how your colorant setup affects the printing**
  - ⇒ Light & Dark inks share the same channel
  - ⇒ Additional inks are used to extend the color gamut (OG or RGB) either in a direct N-color system or in a LUT conversion system
  - ⇒ Special inks (White, Metallic, etc.) are used for special effects in print
  - ⇒ Wider gamut = better coverage of spot colors
  - ⇒ Simplify things, usually same printing resolution with different number of passes means the same amount of ink

18

## 5. ADJUSTMENTS/CALIBRATION

- ⇒ **This stage is the first and most important part of the resulting media set**
- ⇒ **It is foundation on which the ICC color profile will rely and is directly linked to the output quality**
- ⇒ **Parameters to set**
  - ⇒ Ink Limit per Channel (LFP)
    - ⇒ Obvious physical limit or workflow tool automated suggestion (starting point)
    - ⇒ Analogy to offset over and under inking
  - ⇒ Linearization
    - ⇒ Optimal/defined behavior between paper and solid for each channel by meanings of ISO Status density, spectral density or colorimetric TVI
    - ⇒ Actual linearization may be different from the meaning of the "Linearization"
  - ⇒ Total Ink Limit (LFP)
    - ⇒ No ink amount behind this value
- ⇒ **The process is influenced by the driving RIP workflow, so while the general concept may be applied independently, in particular each workflow may have different approach and tools**

19

## 6. CHARACTERIZATION & PROFILING

- ⇒ **Use ISO 12642-2 chart IT8.7/4 (random layout preferred) or the Universal LFP based IT8.7/4**
  - ⇒ From the reference file any custom layout may be generated if necessary
- ⇒ **As per any printed chart in the process control, print it repeated over the entire width of the substrate for practical reasons**
  - ⇒ Automated measuring devices are highly recommended to avoid mistakes and errors (chart contains 1617 patches, 1680 for Universal LFP)
  - ⇒ Average with optional interpolation and smoothing
- ⇒ **This is your characterization data set for the selected printing combination, basically a fingerprint of your printing system for the chosen parameters**
- ⇒ **Our printing condition becomes a fully characterized printing condition**

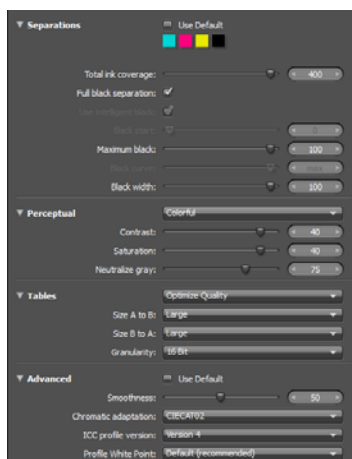

20

## PROFILE GENERATION

- ⇒ **Second stage of the media set based on previously made adjustments and calibration**
- ⇒ **Any modification on the previous stage requires re-printing and re-measuring of the profiling chart (except re-linearization)**
- ⇒ **Typical ICC Output Profile will be generated, but Device Link Profile may be also used**
  - ⇒ Profile generation parameters
  - ⇒ May be optimized thru iterative printing and measurement
- ⇒ **Lighting**
  - ⇒ Usual D50
  - ⇒ Custom light may be used (e.g. Backlit application)

21

## PROFILE SETTINGS

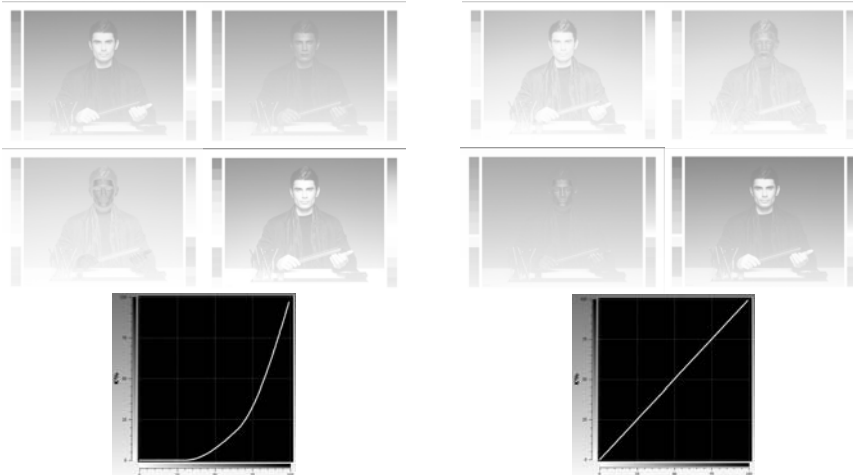

X-Rite i1Profiler

22

- ⇒ **Separation**
  - ⇒ Total ink coverage
  - ⇒ Black start
  - ⇒ Maximum black
  - ⇒ Black curve
  - ⇒ Black width
  - ⇒ Other specific profiler settings
- ⇒ **Profile size and quality**
  - ⇒ Use 16 bit quality
  - ⇒ Use Large, more interpolation points = larger profiles
- ⇒ **Others**
  - ⇒ ICC profile version – use v4
  - ⇒ Chromatic adaptation – use CIECAT02

## GCR VS. MAX K

23

## MAX K - FULL BLACK SEPARATION (LFP)

- ⇒ **PRO's**
  - ⇒ Best neutral visual pleasing grey ramp under any illumination
  - ⇒ Least amount of ink used in calculation based on K channel, hence contribute towards reducing ink consumption
  - ⇒ Very good image contrast also related to K channel
- ⇒ **CON's**
  - ⇒ May lead to loose some tones in the light area, irrelevant for small drop size ink
  - ⇒ Black dots may be seen in light areas that may be visually disturbing for sensitive applications (e.g. backlit), irrelevant for small drop size ink
- ⇒ **Overall it is the best balanced separation setup for a wide range of applications**

24

## 7. VALIDATION

- ⇒ **Topics to check:**
  - ⇒ Stability of the printing system for a given printing condition (device mode 1:1)
  - ⇒ Deviation from aim values of the printing condition to be simulated
  - ⇒ Summed up = total quality
- ⇒ **Tools:**
  - ⇒ Control strip or chart
  - ⇒ Measuring device
  - ⇒ Proper identification of the test jobs = job ticket
  - ⇒ Pass/Fail tolerances adapted from already established Validation Print tolerances for the purpose of internal warning tolerances

25

## 8. QUALITY ASSURANCE

- ⇒ **Periodically calibration or re-calibration recommended**
  - ⇒ If it fails a new characterization may be required
  - ⇒ Monitor and record the Pass/Fail evaluation for tracking purposes, it will show up trends useful to fix issues before they become problems
- ⇒ **Track other variables like environment temperature and humidity**
  - ⇒ Monitor your substrates supplier new batches
- ⇒ **Put all the know-how into simple and well designed SOP for this purpose, it will save a lot of time and money when it comes to corrective actions**
  - ⇒ In order to facilitate a proper understanding of "what we see" tag one copy of the print run with a proper job ticket
  - ⇒ Store safely this proper identified copy for each major job in order to deal with later complains in a professional objective matter
- ⇒ **Define the evaluation method (side-by-side or media relative) and the colour accuracy tolerances based on the appropriate reference set**

26

## SIDE BY SIDE EVALUATION

- ⇒ This approach is similar with the contract proof or validation print application
- ⇒ It is intended to be used for type of substrates that “look and feel” color and appearance wise similar as the simulated printing condition substrate
- ⇒ Requires an 1:1 output or a simulation with absolute colorimetric intent (with or without white point simulation)
- ⇒ **PRO's**
  - ⇒ Very good visual match with a proof or conventional printed sheet
- ⇒ **CON's**
  - ⇒ Limited application considering the wide variety of substrates used in digital printing
  - ⇒ Only works properly if the color gamut of the source is at least within the destination

27

## MEDIA RELATIVE EVALUATION

- ⇒ In digital printing nobody wants to see something printed where the input document shows C=M=Y=K=0
- ⇒ Requires an 1:1 output or a simulation with relative colorimetric intent (with or without black point compensation)
- ⇒ **PRO's**
  - ⇒ Best balanced approach considering the wide variety of substrates used in digital printing
  - ⇒ Allows the printing of the same data across different digital LFP technologies and substrates
- ⇒ **CON's**
  - ⇒ Problematic if requires a very good visual match with a proof or conventional printed sheet
  - ⇒ Transformation is limited to color gamuts that are similar in size and shape by means of evaluating the pertinent lightness difference in the black and white points

28

## REPORTING PROTOCOL

Print created by:	Dorin Pitigoi	Date:	07.01.13 / 18:04					
Last calibration:	20.07.12	Workflow:	Caldera v9					
Measuring device:	X-Rite i1Pro2	Measuring conditions:	45/0, D50, 2, M0, WB					
Printing condition:	FOGRA39	Reference profile:	ISOcoated_v2.icc					
Printer:	HP Designjet L26500	Colorant:	HP Latex Inks HP 792					
Substrate:	HP Photo-realistic Poster Paper	Output profile:	Designjet-L26500_HPPrPPHP2_600_CM YKcm_12pB.icc					
Printing mode:	CMYKcm 600 12-pass-Bi	Intent:	Absolute colorimetric

29

## SPOT COLOURS HANDLING

- ⇒ **Spot colours are used mostly as solids, compared to tone values or overprints with other colors**
- ⇒ **Sources**
  - ⇒ Spot colours libraries – make sure that there is consistency between the file reference and the available library (example 364 C, Pantone vs. Pantone+)
  - ⇒ Physical sample thru measurement – same considerations as any measurement
  - ⇒ Digital file container consisting of physical aspects and specific information of the colour – CxF/3, CxF/X
  - ⇒ With the addition of CxF/X-4 complete characterisation (solid, tones, opacity) allows reliable printing and proofing of products designed using spot colour inks
- ⇒ **How to print The Expected**
  - ⇒ Unambiguous communication of colour specification and tight measurement protocol
  - ⇒ Accurate characterization of the output printing condition
  - ⇒ Check if in-gamut colour and tweak either the reference (media dependent reference) or the output mapping (media dependent CMYK+ recipe) for a best match (smallest  $\Delta E^*00$ ) colour reproduction for a given printing condition

30

## VISUAL COMPARISON AND APPRAISAL

- ⇒ **The best viewing condition for the visual assessment of colour is that in which the product will be finally seen, but such an opportunity is very rare**
  - ⇒ For critical purpose of colour comparison and appraisal, an ISO 3664:2009 compliant viewing booth/illuminant shall be used
  - ⇒ From other industries best practices, additional illuminants should be used for informative checking of metamerism and inconstancy

31

## PSD IN PRACTICE – HYBRID WORKFLOW (ACTUAL CASE)

- ⇒ **POS/POP production using conventional (screen) and digital (LFP) printing technologies**
- ⇒ **Scope of the project**
  - ⇒ Brand colour matching between conventional (spot colour) and digital printing (process CMYK) not only under D50, but also A and TL84 on various substrates
- ⇒ **Tools**
  - ⇒ iCQ and eXact for standard definition and Pass/Fail analysis
  - ⇒ i1Profiler and i1Pro2/iO2 for advanced profiling and optimization of digital printing conditions
- ⇒ **Achievements**
  - ⇒ Dependent standards definition for various digital printing conditions
  - ⇒ Max 2,5  $\Delta E^*00$  difference between Master Standard reproduction (screen) and Dependent Standard reproduction (digital) under any of the 3 illuminants checked

32

## PSD IN PRACTICE – LFP WORKFLOW (ACTUAL CASE)

- ⇒ **Print on demand interior decoration using digital (LFP) printing technologies on wallpaper, SAV and Canvas**
- ⇒ **Scope of the project**
  - ⇒ Reduce ink consumption, increase colour accuracy (reproduction quality) and colour consistency (day-to-day, press-to-press)
- ⇒ **Tools**
  - ⇒ i1Profiler and i1 iSis for advanced profiling and optimization of digital printing conditions, built-in HP spectrophotometer for process control
  - ⇒ i1Pro2 and 3<sup>rd</sup> party tool for QA check of PSD quality levels conformance
- ⇒ **Achievements**
  - ⇒ 3% to 19% ink usage reduction dependent on the substrate used due to excellent MaxK profiling generation provided by i1Profiler
  - ⇒ Colour accuracy level increased by one level (from B to A on SAV and Canvas, from C to B on wallpaper, ABC based Fogra PSD evaluation)
  - ⇒ Average 1,5  $\Delta E^*00$  colour consistency between runs and presses (sampling)
  - ⇒ Bonus: productivity increase due to faster printing speed possibility

33

## APPLYING PSD IN BRIEF

- ⇒ **PSD concept correctly implemented as industrial procedure works very nicely for any application**
  - ⇒ Applications produced in hybrid workflows (mixture of conventional and/or digital printing technologies) - printing the expected
  - ⇒ Digital produced applications are no longer limited only to traditional applications – garments textile and interior decorations
  - ⇒ Spot color reproduction requires similar level of quality control as already established color critical reproduction applications
- ⇒ **Demonstrate that you understand customer expectations**
  - ⇒ Improve colour communication throughout the production chain
  - ⇒ Implement objective means for your process control and quality assurance

34

## Thank you for your attention Q & A

Dorin Pitigoi  
colour & standardization expert

Expert and head of Romanian delegation at ISO TC 130 (Graphic Technology)  
Contributor to WG 2 (Prepress data exchange), WG 3 (Process control and related metrology), WG 13 (Printing Conformity Assessment Requirements), TF 3 (Workflow standards roadmap), JWG 14 (Print quality measurement methods)

Current editor of ISO/TS 15311-3, Graphic Technology - Requirements for printed matter utilizing digital printing technologies for the commercial and industrial production – Part 3: Large Format Signage Printing

FOGRA PSO QUALIFIED PARTNER & DIGITAL PRINT EXPERT  
UGRA CERTIFIED EXPERT
